U01 section refers to a uniform random variable on 0 to 1.

rng stands for random number generator, which in this case is named "HDR10" and is an HDR2.0 function (current HDR Generator with an iteration counter and 4 seeds). In theory other RNGs could be supported as well.

The arguments of the HDR are the Monte Carlo iteration counter (PM\_Index), and the four seeds as specified.

SIPs section starts here. This example has only one.

This SIP is named "Total Damage" and is driven by a U01 named "HDR10".

The function is a Generalized Metalog. This requires a specialized AP on the client computer.

The arguments are in general a multi-dimensional table of a-coefficients associated with the parameters of the Generalized Metalog.
